Formation and Evolution of Black Holes in the Galaxy 2003 in published papers h a bethe and g e brown worked out the collapse of large stars and supernova explosions they went on to evolve binaries of compact stars finding that in the standard scenario the first formed neutron star always went into a black hole in common envelope evolution c h lee joined them in the study of black

hole binaries and gamma ray bursts they found the black holes to be the fossils of the gamma ray bursts from their properties they could reconstruct features of the burst and of the accompanying hypernova explosions this invaluable book contains 23 papers on astrophysics chiefly on compact objects written over 23 years the papers are accompanied by illuminating commentary in addition there is an appendix on kaon condensation which the editors believe to be relevant to the equation of state in neutron stars and to explain why black holes are formed at relatively low masses

The Chemical Evolution of the Galaxy 2012-12-06 this book is based partly on a lecture course given at the university of tri este but mostly on my own research experience in the field of galactic chemical evolution the subject of galactic chemical evolution was started and developed by beat rice tinsley in the seventies and now is a flourishing subject this book is dedi cated to the chemical evolution of our galaxy and aims at giving an up to date review of what we have learned since tinsley s pioneering efforts at the time of writing in fact books of this kind were not available with the exception of the excellent book by bernard pagel on nucleosynthesis and chemical evolution of galaxies cambridge university press 1997 and the subject of galactic chemical evolution has appeared only as short chapters in books devoted to other subjects therefore i felt that a book of this kind could be useful the book summarizes the observational facts which allow us to reconstruct the chemical history of our galaxy in particular the abundances in stars and in interstellar medium in the last decade a great deal of observational work mostly abundance determinations in stars in the solar vicinity has shed light on the pro duction and distribution of chemical elements even more recently more abun dance data have accumulated for external galaxies at both low and high redshift thus providing precious information on the chemical evolution of different types of galaxies and on the early stages of galaxy evolution
